

Pick of the Month – Ready for Spring

Mechanical weed and moss removal offers an environmentally friendly method of keeping footpaths, walkways and other hard surfaces clear and safe to use without the use of chemicals.

PERFORMANCE

Dealing with moss and weeds? Kersten's special brushes not only remove the offending weeds and moss, but also remove the cause; organic detritus that harbours the moisture that allows the growth. Kersten's various brushes can be used with a variety of units, either self-propelled pedestrian or tractor mounted. They can be used on a variety of hard surfaces such as concrete, tarmac and block paving. Remember that to keep moss at bay regular sweeping is essential. No chemicals required.

RELIABILITY

Spreading seeds and fertiliser? Meyer's Blasters have the most powerful spreader motor available. The Blaster's unique ½ horsepower, direct-drive motor is rated at up to 70 amps of surge power and 15 ft. lbs. of stall-torque. The hoppers are made of rust-proof, high-density polyurethane...the hopper frames are powder coated with automotive style paint...the nine-inch spinners are made of stainless steel...and the electrical harnesses include watertight, marine-style connections.

EASE OF USE

One customer said, "...we have looked at various options to mechanically clean footpaths and block paving. ...last year we trialed this machine ... on various types of footpaths and roads which hadn't been swept for over 10yrs. The machine removed the moss, debris, etc., and swept them up leaving a clean path. We have been unable to source a similar machine that meets all the manual handling requirements with the same results and need to purchase the machine ready for the summer."
